MODERNIZED
RECORD KEEPING

Aumentum Recorder is a government records management software that helps you create and maintain a wide range of records, including real estate, licensing, vitals, and marriage.

The Aumentum platform is built on four REST pillars: Reliability, Efficiency, Security, and Trust. The pillars strengthen the public trust by helping to modernize information systems, improve public service, and streamline processes. Since you must deliver these same values to your constituents, we make sure they're also the key to our platform and technology.

Reliability

Aumentum creates a digital infrastructure where public information is open and available, easily managed and updated, accurate, and shareable. The platform can offer a multi-purpose, multi-stakeholder data portal to share, use, and access information. As a single definitive platform, information can be accessed by government, stakeholders, and citizens alike.

Efficiency

The platform enables you to improve cost controls with operational efficiencies and strengthen tax revenue processing. You'll have integrated, connected processes that streamline data administration for equitable, fair, and cost-effective results. Not only can it be deployed from anywhere (your infrastructure, public cloud, or HRS datacenter), you can eliminate manual processes.

Security

Using the most current digital standards and industry best practices to ensure data integrity, the platform helps you strengthen institutional trust to build, leverage, and maximize the stewardship of public data for future generations. Not only do we ensure that your constituents' information is secure, but Aumentum Recorder now provides you with enhanced sealing functionality to help you keep non-public records protected. With so many court and law enforcement requests to seal records, it's vital that you keep up with demand.

Trust

Because it's based on feedback from our multiple customer channels, our iterative design is constantly improving and being validated through testing — usability testing to improve quality, and automated testing to enhance trust. This allows us to provide a transparent platform that simplifies workflows for you, your constituents, and stakeholders.

Aumentum Recorder Capabilities

Not only are the distinct advantages above woven into every Aumentum product, they also allow for data to be collected only once and then populated into other integrated systems — including tax billing and collection, property assessment, and e-government. This helps you to increase your productivity and accuracy and immediately alert other agencies of property ownership changes, while eliminating redundant entries and duplication errors.

Additionally, the platform gives you the ability to scale your software across all offices — achieving even more for your community.

Analytics. Get multiple statistical reports and views that shows the workflow of the officeand individual employees. Detailed auditing runs automatically, providing you the business critical data needed to drive accountability and efficiency.

eRecording. Process and return electronic documents with attorneys, title companies, and other entities. This advanced workflow streamlines document submission and indexing, audits every step of the process, improves turn-around time, and reduces costs for both your office and your customers, as well as the submitter.

Security. Allow variable security to be applied to documents at various levels of document sealing. The system's security utilizes auditing layers for user, workstation, and document tracking, creating a tightly secured system that helps guard document integrity and confidentiality — and increase public trust.

Vitals and Marriage. Allow for the reception, scanning, indexing, importing, and imaging of birth, death and marriage records. Create certified copies of vital records directly from the certificate image and use the security paper tracking to maintain your bond paper inventory.

Visual Workflow. Drag and drop individual workflow components to optimize the records management process. Since the changes do not require programming, the modifications are instantly available in real time.

Cashiering and Accounting. Includes a robust and integrated cashiering system with cash drawer support, point-of-sale credit card processing, refund and non-sufficient fund check tracking, auto-fee calculation, and ledger disbursement. Other features include support for slip printers and fully audited receipt adjustment capabilities.

Web Public access. Web Access increases staff productivity by reducing office foot traffic and providing instant access to county records over the internet. Besides extensive search, view, and print functionality, advanced features such as ordering certified copies, export, and full text searching as well as full eCommerce integration is available which includes depositing funds to an escrow account.

Security. The system's security goes beyond the expected with overlapping layers of security. Interleaved between these layers are auditing layers for user, workstation, and document tracking.

Backfile Conversion. Offers comprehensive scanning conversion of hard copy media to digital images, fast and highly accurate indexing and/ or index verification services to support the preservation of your records.
